Presenting the Walkthrough

in four minutes

Care Triage · a word-for-word script, with what is on screen while you say it

Forty seconds on camera, then one page of the app, the Walkthrough, which is the page `streamlit run app/dashboard.py` opens on. Five stops, a Next button, one live run. About 471 spoken words: 3:29 at 135 words a minute, 3:37 read slowly to a camera, which leaves room. The shape: what you build and the bank's inbox, one email and the question, four steps done live, the one the system got wrong, the same sorter on reviews with the SQL behind it, what changed, the honest number, day one.

Before you start, once

Once: install the requirements and Ollama, then `ollama pull nomic-embed-text` and `ollama pull llama3.2`.

Before you start, every time

1. Start Ollama. Run `streamlit run app/dashboard.py`. The browser opens on the Walkthrough. Set the browser zoom to 125% and switch on Focus, top right, so the side menu is hidden for the recording.
2. On stop 1 press "Let them arrive" once as a warm-up, so the models are loaded. Press Next to stop 2, keep "Charged twice this month" selected, press "Handle this email" once as a warm-up. The first draft loads the model and is slow. Note how long the draft card takes; that is the pause in Part 3.
3. Delete `out/reviews.jsonl` if it exists and reload, so the review counters start at zero. On stop 1 press Reset under the feed so it is ready to arrive again. Press Back to stop 1.
4. If Ollama is not running, stop 2 says so and the other four stops still work. Say the words anyway and point at the step cards, or open any email in the Inbox and show its steps there.

The script

Each part has two blocks: what is on screen, and what you say. Say it the way you would explain it to a friend. Pauses are fine.

PART 1 Who I am, and what I build 0:00

SHOW Camera. Look at the lens, not the screen. Forty seconds, calm.

SAY

Hi, I'm Khushi Gor. I'm an AI engineer. For a year and a half at Must IT Services I built AI for clients, mostly in finance: classification and sentiment pipelines, retrieval systems, guarded generation. I took them from the OpenAI platform to deployments inside the client's own walls, where the data never leaves.

SAY

One client, a bank, had an inbox problem. Every email was sorted and answered by hand. I built the system that sorted them, read the mood, found the policy, and drafted the reply for an agent. I can't show you theirs, so I rebuilt it for AlgaeCal in a weekend, from your guarantee, your products and your reviews.

PART 2 The pile 0:49

SHOW Switch to the screen. Walkthrough, stop 1. Jean's email on the left, the count on the right, the question underneath, then the button "Let them arrive". Click it as you say "Now the pile": fourteen emails land one after another and each is sorted, matched to the policy and routed by the real pipeline as it arrives, under a second each. Ask the question over the top of them landing.

SAY

Picture one email. Jean was charged twice. Now the pile. The question: could we sort it before a person opens it, and give them a head start on the reply?

PART 3 Four steps, live 1:03

SHOW Press Next. Stop 2. "Charged twice this month" is already selected. Click "Handle this email" as you say "Four steps, live". The first three cards fill in under a second; the brief and the draft say "writing" for a few seconds, so keep talking; the last card shows "Looks safe" with green ticks. Point at each card as you reach it. Each one carries a tag: AI model, generative AI, rule, or person.

SAY

Four steps, live. One, sort: a small model I trained on labelled emails says what it's about and how she feels. Billing, and unhappy. Two, find the page: search pulls your policy, and a language model throws out the paragraphs that don't answer her. Three, the same model writes a two-line brief and a first draft from those paragraphs only. It can't promise refunds or give health advice. Four, a person decides.

SAY

Scan results, health questions, anyone cancelling over results skip the draft and go to a Bone Health Consultant. That's a rule I wrote, not the model.

PART 4 The one it got wrong 1:46

SHOW Press Next. Stop 3. Muriel's email on the left, the draft on the right. Hover the highlighted sentence on "taper off", point at the red Fail row, then at the scorecard for the last two sentences. Slow down here.

SAY

The part I'm proudest of went wrong. Muriel asked about switching from basic to Plus. The draft told her to taper off her dose. Nothing in your pages says that. My check, rules, not another model, asks every sentence where it came from. That one had no answer. The draft failed, a person wrote the reply. It never sends, every step is logged, a person has the last word. That's responsible AI in practice.

PART 5 Your reviews 2:19

SHOW Press Next. Stop 4. The amber "Price and value is rising" notice and the weekly chart on the left, a two-star review with the model's one-line read and the drafted public reply on the right. Point at the red bars for "climbing", the notice for "the week it happens", the reply card for the last sentence.

SAY

Then the same sorter on reviews, a hundred written to match your public ones. One table, shaped for your BigQuery warehouse, and every number on the page is a SQL query I wrote. It found price complaints climbing in the last three weeks. The business hears that the week it happens. And a bad review about a scan or a side effect never gets a public reply; a consultant calls.

PART 6 What changed, and the honest number 2:50

SHOW Press Next. Stop 5. Four numbers, two short paragraphs, the table of "when it says sure, it is right N in 10".

SAY

What changed: agents get each email sorted with a draft to edit, and the team lead gets the week on one screen. The honest number: right about three times in four on emails it has never seen. So a person always decides.

SHOW Camera, for the last paragraph. Stop recording two seconds after the last word.

SAY

On day one I'd sit with your consultants and label real emails, because their judgement is what this should learn. Your values page says do the right thing even when it hurts. For me, that's showing you the draft that made something up. Thanks for watching.

Shot list

Time	On screen	Action
0:00	Camera	Part 1: what you build, the bank, why this rebuild. Forty seconds.
0:49	Stop 1	Jean's email, click "Let them arrive", the question over the landing emails.
1:03	Stop 2	Click "Handle this email". Talk through the wait. Point at the ticks.
1:46	Stop 3	Muriel's draft. Hover the sentence, point at the Fail row, then the scorecard.
2:19	Stop 4	The rising-theme notice, the red bars, the drafted public reply.
2:50	Stop 5	Four numbers, the honest-number table, then camera.
3:09	Camera	Last paragraph. Done by about 3:29.

If it runs long

In this order, until the timed run is under 3:45:

1. Part 6: drop "On day one I'd sit with your consultants and label real emails, because their judgement is what this should learn."
2. Part 3: drop "That's a rule I wrote, not the model."
3. Part 5: drop "The business hears that the week it happens."

Plain words

Keep these off camera: embedding, classifier, logistic regression, retrieval, RAG, vector, BM25, LLM, cosine, threshold, pipeline, latency, out-of-fold, calibration. Say "the system" or "the sorter". The AI phrases in the script are "a small model I trained" and "a language model", both in Part 3. If someone asks which one, it is llama3.2 running on the laptop with no internet, and the check in Part 4 is rules, not a model. Do not say the system "understands" emails or "knows" the policy. It sorts, finds and drafts. A person decides. Do not apologise for the error in Part 4. It is the point of the story.

If they want more

If they want more after the video: the Live triage page takes any email typed into it, the Inbox has all 110 emails with every step, and Model facts has the honest numbers, including the ones that are not flattering. Repo: https://github.com/meetgajjarx07/care-triage.
